

# Collaboration all around

MeetingPoint is an open source software, released under GPLv3 license, based on Flash technology: it uses the RED5 open source server and a browser with Flash pluing on client side. Modularity, ease of use and the integration in Moodle's synchronous activities set, are the goals that have driven our project. Modularity is the most interesting feature: third party developers can add external components using the MeetingPoint APIs.

MeetingPoint was created as a videoconference tool with audio, video, chat, poll, shared whiteboard and slideshow presentation, but thanks to it's core architecture you can fit it to any online collaborative application.

If you want to join us in development, support, get more infos or just to try MeetingPoint, go to TEL Lab website.
